## File Tree

```
string_replace/  
├── string_replace.c  (to submit)  
└── string_replace.h  (to submit)
```

**Authorized functions** : You are only allowed to use the following functions

- malloc(3)
- calloc(3)

**Authorized headers** : You are only allowed to use the functions defined in the following headers

- err.h
- errno.h
- assert.h
- stddef.h

**Compilation** : Your code must compile with the following flags

- -std=c99 -pedantic -Werror -Wall -Wextra -Wvla

**Main function** : None

## 1 Goal

You have to implement a function that copies the string `str` to a newly allocated string while replacing each `c` character with the string `pattern`. The function returns the new string.

```
char *string_replace(char c, const char *str, const char *pattern);
```

- The `c` character cannot be `\0`.
- If `pattern` is `NULL`, every occurrence of the `c` character will be removed in the new string.
- If `str` is `NULL`, `string_replace` returns `NULL`.

## 2 Example

```
#include <stdio.h>  
#include <stdlib.h>  
  
#include "string_replace.h"  
  
void check(char c, const char *s, const char *p)  
{  
    char *res = string_replace(c, s, p);
```

(continues on next page)

(continued from previous page)

```
    printf("%s\n", res);
    free(res);
}

int main(void)
{
    check('o', "bobo", "");
    check('o', "bobo", "i");
    check('o', "bobo", "oo");

    return 0;
}
```

```
42sh$ gcc -Wall -Wextra -Werror -std=c99 -pedantic -o replace string_replace.c main.c
42sh$ ./replace | cat -e
bb$
bibi$
booboo$
```
