└─ sieve.c   (to submit)
```

## Makefile

- all: Generate sieve.o

**Authorized functions** : You are only allowed to use the following functions

- printf(3)
- malloc(3)
- free(3)
- calloc(3)

**Authorized headers** : You are only allowed to use the functions defined in the following headers

- err.h
- errno.h
- assert.h
- stddef.h

**Compilation** : Your code must compile with the following flags

- -std=c99 -pedantic -Werror -Wall -Wextra -Wvla

**Main function** : None

## 1 Goal

The goal here is to create a sieve of Eratosthenes. It is a simple iterative sieve for finding prime numbers.

It works with an array of numbers from 2 to  $n$  ( $n$  excluded). The first number, 2, is identified as a prime number. Then, all multiples of 2 are marked. When encountering a new unmarked number, it is identified as a prime number, and its multiples are marked.

You must write a function taking an integer  $n$  and printing the number of prime numbers from 2 to  $n$ , excluded.

```
void sieve(int n);
```

If  $n$  is equal or lower than 2, the function will not print anything. Your function will have to be optimized as it will be tested with large values.

## 2 Examples

You can use a `main` to test your program, but it must not be included in your submission. Calling the `sieve` function with the first program argument as parameter, will produce the following output:

```
42sh$ ./sieve 11 | cat -e
4$
42sh$ ./sieve 0 | cat -e
42sh$ ./sieve 1000000 | cat -e
78498$
```
